PROFESSIONAL SUMMARY

Backend & DevOps Engineer with 1+ year of experience building scalable RESTful APIs, event-driven systems, and cloud-native infrastructure. Skilled in FastAPI, Kafka, and microservices architecture, with hands-on experience in Kubernetes, CI/CD, and Infrastructure as Code. Proven ability to design backend systems, integrate services, and build automation workflows that improve scalability, reliability, and performance.

EDUCATION

B.Tech - Computer science and Engineering-Data Science	2020-2024
ABES Engineering College, Ghaziabad	CGPA- 7.48

TECHNICAL SKILLS

Backend & APIs	Python (FastAPI), REST APIs, JWT Authentication, Webhooks
Databases & Caching	MongoDB, Redis, PostgreSQL/MySQL
Distributed Systems & Messaging	Apache Kafka, Event-driven architecture
Cloud & DevOps	Docker, Kubernetes, Terraform, AWS (EC2, S3, VPC, IAM, Lambda)
CI/CD & Tools	GitHub Actions, Jenkins, ArgoCD, Git
Messaging & Distributed Systems	Apache Kafka, Event-driven Architecture
Monitoring & Observability	Prometheus, Grafana

EXPERIENCE

Software Engineer	Oct 2024 - present
Wittybrains Software Technologies	Noida, UP

- Designed and developed FastAPI-based RESTful microservices for real-time video processing, integrating RTSP streams with MinIO storage and enabling scalable backend systems.
- Built event-driven architecture using Kafka with asynchronous processing across Kubernetes pods, improving scalability and system performance.
- Containerized applications using Docker and deployed on Kubernetes, achieving 99.9% availability with automated scaling and reliable service orchestration.
- Implemented CI/CD pipelines (GitHub Actions) and provisioned infrastructure using Terraform (VPC, ECS, IAM, ALB), integrating Prometheus & Grafana for monitoring and automation workflows.
- Developed a reusable **internal Python SDK** for stream lifecycle management, logging, MinIO storage integration, and Kafka messaging, reducing microservice code duplication and improving developer productivity.

PERSONAL PROJECTS

Serverless Image Resizer (Link)

Technology used - AWS Lambda, Python, Terraform, CI/CD(github action), AWS S3

- Automated infrastructure using Terraform and CI/CD pipelines.
- Implemented secure IAM roles and scalable event-driven processing.

Food Ordering System - Backend API (Link)

Technology used - FastAPI, MongoDB, JWT, CI/CD(github action), Docker and Redis

- Designed and developed a production-grade backend system using FastAPI asynchronous APIs, implementing a modular layered architecture (Routes → Services → DB) to manage restaurants, menus, and order lifecycle workflows.
- Implemented JWT authentication, RBAC, and secure session management.
- Designed order lifecycle workflows and automation, integrating Redis for caching and rate limiting.
